Intro to Internet Computing

The most difficult and time consuming part of this assignment was trying to implement an editing system. Apart from that, it was awkward trying to learn jQuery for me because it was so similar to previous programming languages I have learned, but different enough that I was constantly thrown off by it. I used the example from javascriptbook.com that was listed in the project guidelines PDF as a starting point, then proceeded to make heavy modifications to it from there. I tried to implement a double-click-to-edit functionality to my app, but was unsuccessful in doing so. Every time I tried to double click during testing, the single click function would activate twice instead. I looked up a possible solution and found several ways to time clicks within the code, but in the end I decided to use a different input method for that function. For editing, I wanted to implement the ability to save the edit by hitting the enter/return key and save using local storage, but I was not able to do so and decided to just turn in what I had completed.

I used Brackets for all of the code and tested this website in Google Chrome and Microsoft word.
